BASELINE SURVEYS OF FISH HABITATS IN EASTERN NPR-A: 2001

INTRODUCTION

PHILLIPS Alaska Inc. has been exploring for oil within the eastern portion of the National Petroleum Reserve-Alaska (NPR-A) since the winter of 1999/2000. Significant oil reserves have been located in the region, and the feasibility of developing a producing field in the area is being investigated. Part of the evaluation process includes assessing the potential environmental impacts.

In order to submit applications for exploration and development permits, information specific to the activity area is required in order to evaluate the biological sensitivity of streams and lakes in the region. Streams in the area may be crossed by ice roads during winter or by roads and/or pipelines after development. An understanding of the fish populations in these streams is needed to minimize effects to these populations during field development. The inventory of fish and fish habitat provides information for assisting permitting decisions regarding road and pipeline routing. In addition, streams in the area will likely be crossed by ice roads, so an understanding of potential overwintering areas is also desirable. A key element of the study is identifying movements and distribution of fish utilizing the stream systems.

Streams in the study region have previously been investigated by Netsch et al. (1977), and Bendock and Burr (1984). These surveys consisted of one-day visits at each site for inventory-level surveys over a wide area, with sampling by gill net, seine, minnow trap, and angling. Species reported from Fish Creek and Judy Creek included broad whitefish, arctic grayling, round whitefish, slimy sculpin and ninespine stickleback. The Ublutuoch River was also reported to contain arctic grayling, slimy sculpin and ninespine stickleback.

Lakes also provide substantial fish habitat in or near the potential development area, and are sources of water needed to support field operations, including drilling, ice road construction and camp use. The thick ice cover during winter (approaching 7 feet by late winter) limits the amount of water available to fish, and the amount of winter habitat is considered a critical feature in controlling fish populations (Craig 1984, Power 1997). A substantial number of lakes have been surveyed throughout NPR-A, however, few of these were in the present study area (Netsch et al. 1977, Bendock and Burr 1984, 1985, McElderry and Craig 1981). Studies of fish use of lakes in eastern NPR-A specific to the PHILLIPS Alaska exploration were initiated in 1999, and are reported in Moulton (2000a,b, 2001).

The present study was the first detailed examination of fish populations in the drainages of eastern NPR-A. The study was designed to provide details of fish populations in eastern NPR-A (Figure 1), and the habitats used by those populations, so that oilfield facilities can be sited, designed and constructed in a manner that will avoid or minimize impacts. Specific objectives of the 2001 fish survey were to conduct studies on the Fish Creek and Ublutuoch River drainage systems to:

- a) describe the fish populations and habitat use patterns within the streams,
- b) obtain information on fish movements within the drainages,
- c) document the recovery of tagged fish in both study nets and the Nuiqsut fishery from different release locations.

The study included cooperative efforts among PHILLIPS Alaska, the North Slope Borough (NSB) and Alaska Department of Fish and Game (ADF&G). An additional objective was to provide fish for radio-tagging by ADF&G.

METHODS

During 2001, fyke nets were used to sample the major drainages and lakes in the eastern NPR-A study area (Figure 2). The initial sampling design planned for long-term fyke net stations in lower Fish Creek, upper Fish Creek (i.e. upstream from the confluence of Fish Creek and Judy Creek), Judy Creek, and the Ublutuoch River. An additional station was added to the tapped lake MC7916, a lake that had previously been surveyed in 1979 by McElderry and Craig (1981). A variety of stations were sampled when attempting to find stations suitable for the long-term monitoring (Table 1). The rapidly decreasing flows in June and unstable streambeds in Fish Creek and Judy Creek necessitated adjustments in the fyke net location in the early season until reasonably stable sites were located. Additional sampling was conducted in three perched lakes near the confluence of Fish and Judy creeks (Figure 2).

Sampling was by fyke net so that fish could be released unharmed. Sampling covered late June (June 20-28) to evaluate post-breakup movements, late July (July 19-30) to evaluate fish use of channels after spring out-migration was complete, and the end of August into early September (August 25-Sep 2) to evaluate potential movements to wintering areas.

Fyke nets used during the 2001 sampling had an opening 0.9 m deep by 1.1 m wide, the trap end was 4.9 m long, made of 9.5 mm mesh. The wings (5 m long) and lead (15 m long) were made of 12.7 mm mesh. The nets were emptied daily. Fish were measured and released, with no fish retained for laboratory analysis. Duration of each set was recorded to allow calculation of catch rates. Water chemistry measurements taken in conjunction with the fyke net sampling included water temperature, specific conductance, dissolved oxygen, turbidity and pH.

Fish longer than 250 mm were tagged to reveal the extent to which fish caught in the study area contribute to the subsistence catch. Floy FD-68B anchor tags (monofilament = 5/8 inch, vinyl = 1 1/8 inch) were applied to whitefish, cisco, and burbot caught by fyke net. Recapture was monitored in research sampling within Colville Delta and eastern NPR-A study areas, in the Nuiqsut subsistence fishery and in the Colville Delta commercial fishery.

Radio tags were applied by ADF&G to broad whitefish (21 fish), arctic grayling (10 fish) and burbot (8 fish). Details of methods used will be reported by ADF&G.

Water chemistry parameters were measured to assess habitat conditions and provide information on

the suitability of the water for domestic and industrial uses. Water chemistry measurements included surface measures of water temperature, specific conductance, dissolved oxygen, pH, and turbidity. Temperature, specific conductance and dissolved oxygen were *in situ* measurements taken at a depth of approximately 0.5 m near the trap end of the fyke net with a YSI Model 85 meter. A sample obtained from the surface was returned to the field office to measure pH and turbidity. PH was measured with either a Coning pH meter or an Oaktron pH Tester III. Turbidity was measured with an H.F. Scientific DRT15CE turbidity meter.

RESULTS AND DISCUSSION

Physical Environment

Sampling began in June as stream flows were receding from peak break-up flows (Figure 3). The rapidly decreasing flows in June necessitated almost daily re-positioning of the fyke nets to ensure the nets were fishing properly. Sampling during July and August was during the period of consistent base flow, thus nets were more stable and performed more efficiently. The streambed in Fish Creek and Judy Creek, however, was unstable sand and silt that shifted constantly during the sampling period. This unstable bed affected net stability even with a consistent flow and necessitated frequent maintenance on the net to avoid burying the wings and leads in the shifting sand. In contrast, the Ublutuoch River had a stable gravel bed and the nets fished effectively with minimal adjustments.

By the onset of sampling, water temperature in the streams had risen to over 9°C (Figure 4). Temperatures continued to rise to near 18°C by late July, then declined through August. An ice sheet remained in lake MC7916 through June, which moderated temperatures in the lake, and temperatures decreased when southwest winds moved the ice sheet near the fyke net (Figure 4).

Specific conductance rose slowly at all sites through the summer as snow melt and runoff decreased. Turbidity was highest in Fish Creek after break-up, then gradually declined through the summer. Turbidity in the Ublutuoch River was low throughout the summer, generally in the range of 1 NTU, indicating consistently clear water (Figure 4).

Biological Observations

Patterns of Habitat Use

Substantial differences were found in fish use of habitats associated with the drainages of eastern NPR-A. Fyke nets in the major rivers, Fish Creek and Judy Creek, had the lowest catch rates (Table 4). Fyke nets in tapped lakes (primarily MC7916) had the highest catch rates and highest diversity, which parallels results from the nearby Colville River delta (Table 4). The Ublutuoch River, a clear water tributary to Fish Creek, produced the second highest catch rates.

Catch rates of all species were low in Fish Creek and Judy Creek, with arctic grayling and least cisco

being the most abundant (Figure 5). Arctic grayling were also the most abundant fish in the Ublutuoch River, followed by humpback whitefish, broad whitefish, and round whitefish. Catches in the tapped lake, MC7916, were dominated by broad whitefish and least cisco, with arctic grayling, humpback whitefish and round whitefish being present in lesser numbers.

Based on the overall catch rates, the perched lakes contained arctic grayling and least cisco (Figure 5). This is somewhat misleading because one lake (M9909) contained almost all the least cisco, another (M9910) contained almost all the arctic grayling, and the third had few fish aside from ninespine stickleback (Figure 6). Thus there was considerable variation in species composition in three lakes adjacent to one another. Sampling in lakes from 1999 to 2001 revealed that lakes in close proximity to Fish Creek and Judy Creek, or those connected to the rivers by a stream, tend to be fish-bearing, while those remote from the streams normally do not support fish (Moulton 2000a,b; 2001a). Most of the fish-bearing lakes are in a corridor along Fish and Judy creeks, where high flows at break-up facilitate dispersal (Figure 7).

The tapped lake, MC7916, had previously been sampled by McElderry and Craig (1981) during a survey in September 1979 to locate cisco spawning areas. They reported catching broad whitefish, least cisco and arctic grayling during an overnight set with variable mesh gill nets. All the fish caught were less than 210 mm. This study thus added 8 species to the list of fish known to use the lake.

Habitat Use by Dominant Species

Five species (arctic grayling, broad whitefish, humpback whitefish, round whitefish and least cisco) comprised almost 85% of the total catch; this rose to over 97% of the catch with ninespine stickleback included. Ninespine stickleback were ubiquitous, but were most abundant in lake habitats, and present in low numbers in the river channels. Burbot were encountered in several habitats, and while not numerous, were conspicuous because of their large size. Since they are a top predator and are an important subsistence species, they are included in the species summaries.

Arctic Grayling. Arctic grayling were the most consistently caught species across all habitats and were present in all time periods (Figures 6 and 7). The Ublutuoch River contained the highest abundance of adult arctic grayling through the summer, although they were present in the other habitats as well (Figure 8). Young-of-the-year were caught almost exclusively at the Fish Ck/Judy Ck stations, with none observed in the Ublutuoch River. It is not known at this time whether this is an artifact of sampling or reflects the high abundance of large predatory fish in this system.

Tags were applied to 317 arctic grayling over 250 mm, and 22 tags were eventually recovered during 2001 (Table 8). Most were recaptured near the release location (Table 9), although one moved almost 10 miles from Judy Creek into upper Fish Creek, and another moved nearly 16.5 miles from MC7916 to the confluence of Fish and Judy creeks.

Broad Whitefish. Broad whitefish were the most abundant fish caught, with the majority of the

catch being young-of-the-year caught in lake MC7916 (Figures 9 and 10). Larger broad whitefish were caught primarily in the Ublutuoch River during the late July sampling period, with only scattered records of larger individuals at other locations and during other time periods.

Tags were applied to 124 broad whitefish over 250 mm, and 1 was recaptured (Tables 8 and 9). The recaptured fish was released at the Ublutuoch River on July 26 and recovered in the Nuiqsut fall fishery conducted on the Nechelik Channel on October 20. The recovery location near Nanuk Lake was approximately 45 river miles from the release point.

Humpback Whitefish. Humpback whitefish were fourth in abundance, with most of the catch recorded from the Ublutuoch River, and secondarily from the tapped lake, MC7916 (Figure 11). Unlike most other species, over 90% of the captured humpback whitefish were adults (Figure 12). There was a strong upstream movement of these large humpback whitefish in the Ublutuoch River during the July sampling (July 20-30), which accounted for most of the catch. The second greatest catch was in lake MC7916 in June, which may indicate there is a wintering area in the vicinity, or rapid dispersal from Colville River wintering areas. A few young-of-the-year humpback whitefish were caught in the lake in late August.

Tags were applied to 243 humpback whitefish, with 2 recaptured in the Nuiqsut fall fishery (Tables 8 and 9). The two recoveries had been tagged in the Ublutuoch River during the peak movements in July, and were recaptured in late October, approximately 37 and 45 miles from the release location.

Round Whitefish. Round whitefish were encountered in low numbers in all habitats except perched lakes. They were most abundant in the Ublutuoch River, followed by the Fish Ck/Judy Ck nets (Figure 13). Captured round whitefish covered a broad size range, from 40 to 400 mm, with no size range being dominant (Figure 14). Large individuals were especially abundant in the Ublutuoch River.

Tags were applied to 62 round whitefish, with none recovered to date. Round whitefish rarely enter the subsistence catch, thus recoveries are not expected during the Nuiqsut fall fishery.

Least Cisco. Least cisco were most abundant in lake habitats, including both tapped and perched lakes (Table 4). There was an early season movement in Fish Creek, then an upstream movement in the Ublutuoch River during the July sampling period (Figures 15 and 16). Aside from these two periods, few were caught in river channels. They were present in MC7916 during all sampling periods, over a broad size range (Figure 16). By the Aug/Sep sampling period, young-of-the-year had grown large enough to be caught by the fyke nets, and again were most abundant in MC7916.

Tags were applied to 74 least cisco, with 1 recovered. The recovered fish was tagged in lake MC7916 and was recovered in the Nuiqsut fall fishery, near Nanuk Lake, on October 30. The recovery location was approximately 26 river miles from the release location.

Burbot. Ten burbot were caught by fyke net during the study. Five additional burbot were captured by hoop traps set by ADF&G personnel who were applying radio tags. The burbot were scattered through all of the sampling areas except for the Ublutuoch River (Table 4). Burbot are often associated with dark areas, which are rare in the shallow, clear water of the Ublutuoch River. The captured burbot covered a range of sizes from young fish (four were between 112 to 167 mm), to large adults up to 820 mm. Eleven of the large burbot were tagged, however none were recovered to date.

CONCLUSIONS

The sampling in eastern NPR-A during 2001 indicated that the main river channels of Fish and Judy Creek are sparsely used by fish during the summer and likely serve primarily as migration corridors for fish moving between various other habitats, such as clear water streams, tapped lakes and perched lakes. The unstable channels of Fish and Judy creeks likely limit productivity, and the prey is probably limited compared to other habitats.

The Ublutuoch River, in contrast to Fish and Judy creeks, is heavily used by arctic grayling, humpback whitefish and broad whitefish, with round whitefish and least cisco also present during summer. A high percentage of the fish in the Ublutuoch River were large fish. It is likely that this high density of large fish reduces the value of the drainage as a rearing area as predation is likely to be intense. Arctic grayling, round whitefish and least cisco, in particular, are known to be opportunistic feeders that prey heavily on young fishes.

Lakes connected to the rivers also provide important fish habitat, as evidenced by the heavy use of the tapped lake MC7916, and the perched lakes M9909 and M9910. The value of the lake increases as predictability of access increases. Access to lake M9911 was apparently less frequent than that for the other two perched lakes as few fish were caught. Inadequate access is likely the cause for the low fish densities because the lake has a maximum depth of 15.3 feet, which should be adequate to overwinter fish that gain access.

APPENDIX B
Fish caught in by fyke net
in eastern NPR-A during 2001

Appendix Table B-1. Fish catches in NPR-A fyke net sampling during June 2001.

Station F1/F1A (Fish Ck)

Species	Jun 20	Jun 21	Jun 22	Jun 23	Jun 24	Jun 25	Jun 26	Jun 27	Jun 28
Broad whitefish				3					4
Humpback whitefish									
Arctic cisco				1	1				
Least cisco	10	16	21	9			6		9
Round whitefish	4		2	1					
Dolly Varden char									
Arctic grayling	5	6	8	5			9		13
Burbot									
Alaska blackfish									1
Rainbow smelt									
Fourhorn sculpin									
Slimy sculpin		4		1					
Ninespine stickleback		10		4			2	2	2
Effort (hrs)	23.2	24.5	27.2	24.9			23.1	24.6	17.2

Station F1A (Fish Ck)

Species	Jun 20	Jun 21	Jun 22	Jun 23	Jun 24	Jun 25	Jun 26	Jun 27	Jun 28
Broad whitefish									4
Humpback whitefish									
Arctic cisco								6	9
Least cisco									
Round whitefish									
Dolly Varden char							9		13
Arctic grayling									
Burbot									
Alaska blackfish									1
Rainbow smelt									
Fourhorn sculpin									
Slimy sculpin									
Ninespine stickleback							2	2	2
Effort (hrs)							23.1	24.6	17.2

Appendix Table B-1. Fish catches in NPR-A fyke net sampling during June 2001.

Station F4 (Fish Ck)

Species	Jun 20	Jun 21	Jun 22	Jun 23	Jun 24	Jun 25	Jun 26	Jun 27	Jun 28
Broad whitefish			1			4			
Humpback whitefish					2				
Arctic cisco				5	12	11	8	15	6
Least cisco	1							1	4
Round whitefish									
Dolly Varden char									
Arctic grayling		5		7	32	34	27	9	6
Burbot									
Alaska blackfish									
Rainbow smelt									
Fourhorn sculpin									
Slimy sculpin									
Ninespine stickleback				7	3	4	7	3	6
Effort (hrs)	19.0	30.1	22.6	25.2	23.1	26.8	27.9	18.3	21.3

Station J3 (Judy Ck)

Species	Jun 20	Jun 21	Jun 22	Jun 23	Jun 24	Jun 25	Jun 26	Jun 27	Jun 28
Broad whitefish									
Humpback whitefish									
Arctic cisco									
Least cisco					14				
Round whitefish									
Dolly Varden char									
Arctic grayling			1		1		3		
Burbot									
Alaska blackfish									
Rainbow smelt									
Fourhorn sculpin									
Slimy sculpin									
Ninespine stickleback					1				
Effort (hrs)	20.8	29.8	21.2	24.6					

Appendix Table B-1. Fish catches in NPR-A fyke net sampling during June 2001.

Station J3A (mouth of clear creek off Judy Ck)

Species	Jun 20	Jun 21	Jun 22	Jun 23	Jun 24	Jun 25	Jun 26	Jun 27	Jun 28
Broad whitefish									
Humpback whitefish									
Arctic cisco									
Least cisco						3			
Round whitefish									
Dolly Varden char									
Arctic grayling					18	16	11	3	8
Burbot							1		
Alaska blackfish									
Rainbow smelt									
Fourhorn sculpin									
Slimy sculpin									
Ninespine stickleback									
Effort (hrs)					22.2	26.8	26.7	19.5	22.4

Station U1 (Ublutuoch R upstream of ice road crossing))

¹ Species Codes:

BDWF = broad whitefish
 HBWF = humpback whitefish
 LSCS = least cisco
 RDWF = round whitefish
 GRAY = arctic grayling
 BURB = burbot

² Capture Station:

Nanuk - Nechelik Channel near outlet of Nanuk Lake
 Upper Nigliq - Nechleik Channel near Nuiqsut

³ Notes:

RECAP = tag recapture
 RADIO = radio tag applied
