Lakes Sampled for Fish Within and Near the Colville River Delta, Alaska

Introduction

This volume is a compilation of the results of sampling for fish at a variety of lakes within or near the Colville Delta from 1979 to 1995. Sampling was conducted and reported by three groups of investigators with diverse objectives. Sampling in 1979 was conducted in support of the Outer Continental Shelf Environmental Assessment Program (OCSEAP) and was reported by McElderry and Craig (1981). The objective of the survey was to assess the importance of various lakes for spawning and overwintering of ciscoes in the Colville River drainage. Sampling in 1985 was conducted by the Sport Fish Division of Alaska Department of Fish and Game and was reported in Bendock and Burr (1986). The objectives of the study were to determine the diversity and distribution of freshwater fish inhabiting lakes within the Delta and to characterize the habitats within the delta used for spawning, rearing and migration by the principal fish species. Sampling from 1991 to 1995 was conducted as pre-development baseline surveys for potential oilfield development within the delta. The objectives of the studies were to examine fish use of lakes within the delta and develop a habitat classification system to assist in evaluating potential development impacts to fishes within the delta. Results of the surveys were reported in Moulton (1994, 1996). Additional surveys of chemical and physical characteristics of delta lakes have been conducted by J. Lobdell from 1991 to 1995, but the results have not been released in report form.

The various researchers sometimes re-sampled lakes that had previously been sampled and reported by others. This volume standardizes the lake numbering system such that the original investigator's designation is preserved and subsequent visits to the lakes are cross-referenced to the various project-specific reports.

This volume is a presentation of the data collected and contains no analysis or synthesis of the information. Information contained for each surveyed lake includes:

1. A map of the lake, with the surface area and maximum depth included, when available.
2. Other names utilized for the same lake
3. Lake location, in latitude/longitude and by township and range
4. Habitat classification
5. Catch record, including gear used, date sampled, species caught and size range.
6. Where appropriate data exist, the length frequency of dominant species is plotted.
7. Where data exist, the age-length distribution of least cisco is plotted; a reference growth curve to the anadromous population is included.

¹Perched(F) = Perched lake with an obvious high water channel, likely subject to annual flooding

Perched(I) = Perched lake with no obvious high water channel, likely subject to flooding on an infrequent basis

Tapped = Tapped Lake, a lake with an active connection to a river channel during the summer. The channel is normally a short, low velocity channel formed when the lake was tapped and drained.

Drainage = Drainage Lake, a lake that is part of a defined drainage system, i.e. there is an active connection to a creek.

Numbering Convention for Colville Delta Lakes:

The lake number contains several pieces of information, including the code of the sampler and the year of sampling.

Sampler Code:

MC = McElderry and Craig (1981); sampling in 1979

B = Bendock and Burr (1986); sampling in 1985

L = Lobdell; water quality sampling in 1991-1995

M = Moulton; fish sampling in 1991-1993 and 1995

First Two Numerals:

Year of Initial Sampling

(if Moulton sampled a lake previously sampled by Bendock, then the Bendock lake number is used)

Last Two Numerals:

Numbers from 1 to 99 used to identify the individual lake sampled within a given year.

Bathymetric Transect = Depth in Feet

Definitions for the type of lake habitat.

Tapped = Tapped Lake, a lake with an active connection to a river channel during the summer. The channel is normally a short, low velocity channel formed when the lake was tapped and drained.

Perched (F) = Perched lake with an obvious high water channel, likely subject to annual flooding

Perch (I) = Perched lake with no obvious high water channel, likely subject to flooding on an infrequent basis

Drainage = Drainage Lake, a lake that is part of a defined drainage system, i.e. there is an active connection to a creek
